

ABSTRACT

A computerized method of providing and allowing secure selective sharing of account information between users of an Internet information aggregation system. A grantor user creates one or more view pages, each of the view pages having a plurality of monitors therein. A unique visitation access code is assigned to each of a plurality of grantee users of the system. The grantor uses the visitation access codes to selectively grant visitation access to the grantor's view pages to selected grantees. When a grantee logs onto the Internet information aggregation system via a processor, such as a computer or a mobile device, the system allows the grantee user to select one of the grantors' view pages, whereupon the system displays the selected grantor's view page on the grantee user's display.
